Step 0: Windows XP and basic driver pre-setup

This product is pre-setup with the latest driver file for Windows XP Home Edition, basic specifications and other optional specifications chosen by the user before shipping.

The following is a list of operating systems and basic driver files that are pre-setup.

- Microsoft Windows XP Home Edition
- Intel Chipset driver
- Intel 945G (GMA950) Video driver
- Realtek ALC655 Audio driver
- Marvell 88E8053 PCI-E Fast Ethernet NIC driver
- Intel USB 2.0 driver

[For reference]

The touch screen, wireless LAN, TV tuner (option) must be ordered before the product is packaged and shipped. We regret to inform you that we cannot separately supply a touch screen for products sold without this feature.

Step 1: To set up the computer

To set up the computer that is pre-setup with Microsoft Windows XP Home Edition in step 0:

1. Connect the mouse and keyboard that come with the main body and turn on the power of the main body. The following “Microsoft Windows Start” dialog box will be displayed. To continue the setup, click <Next> at the bottom of the screen.
2. When the “User’s Time Zone” dialog box is displayed, select the proper time zone for your location and select <Next>.
3. When the “ End Users’ License Agreement” menu is displayed, select “I accept this agreement” and then click <Next>.
4. When you see the “Your Product Key” page on the screen, enter the product key specified in Windows XP Home Edition user’s guide that comes with the purchase of this PC and select <Next>.
5. A dialog box will appear asking you to designate a computer name. Enter a computer name and computer description in the blanks and click <Next>.
6. A dialog box will appear asking you how you want to connect to the Internet. Select the one that best suits your connection and press <Next>. If your computer is not connected to a network or failed to establish a network connection, a dialog box with “failed to establish an Internet connection” will pop up. If you wish to set up the Internet connection later, click <Skip>. In that case, you can set up or change the network configuration at [Start]-[Control panel]-[Network and Internet connection] after you are finished installing Windows.
7. If you chose a LAN connection for accessing the Internet, a dialog box reading “High speed connection setup” will be displayed. Fill in the fields and press <Next>.

If you chose DSL or cable modem connections, the below dialog box will pop up. Follow the instructions to continue the network connection setup.

8. When you are finished with the Internet connection setup, a dialog box reading, "Are you going to receive verification service?" will be displayed. Even though you can have the verification right away to know whether your copy of Windows is licensed or not, you are recommended to select "No, not at this time." This is because it is better to activate Windows when you test the computer for a while and you are sure that there are no problems with your new PC. However, you must activate Windows within 30 days.
9. Lastly, you will see a dialog box asking who will use this computer. Enter names of users who will share the computer and press <Next>. To proceed to the next step you have to enter at least one name.
10. When a dialog box that reads "Thank you!" pops up, this means the basic setup is complete. Press <Finish> to reboot your computer and to run Windows XP.

Step 2: The installation of drivers for other peripherals

Skip this step if you do not use other peripherals.

To use other peripherals this PC supports such as printers, serial communication devices, USB devices, IEEE 1394 devices, and game consoles/ MIDI devices, connect the device to the main body, press the power button and boot the PC. When booting is complete, install the pertinent driver in the system. Because the system automatically senses and installs plug-and-play peripherals, follow the instructions displayed on the setup menu and refer to the device's user's guide. For peripherals that are not plug-and-play, users have to install the device and reboot the system for normal operation. Refer to the user's guide of each device for detailed instructions.

Step 3: The installation of software for other peripherals

Skip this step if you do not use other peripherals and go to step 4.

For efficient use of other peripherals (printers, serial communication devices, USB devices, IEEE 1394 devices, and game consoles/ MIDI devices), install the appropriate software (e.g. utilities or other applications provided by the manufacturer of the device) following the instructions displayed on the setup menu and referring to the user's guide.

Step 4: Completion of setup

When you are finished with step 3, basic installation is complete and the computer is ready to use once it is rebooted.

Chapter 4. Using the computer

In this chapter, we will give a brief explanation about the use of the computer

Using other applications

To use other applications obtained or purchased separately, refer to the user's guide of each application provided by the software manufacturer.

Partitioning the hard disk

For user's convenience, the hard disk built into this product is divided into two partitions (drive C and drive D). Drive C, a system drive, is installed with a Windows operating system, a variety of drivers, and other applications when you receive the computer. In contrast, drive D, a usual data drive, is empty.

This is to let users store data in drive D to be protected in the event of a system failure. When the hard disk must be reformatted and the system must be reinstalled due to serious damage to the system, only drive C needs to be reformatted while data stored in drive D is kept intact without any intervention.

Chapter 5. Changing the setup

This chapter will briefly outline how to change the setup to suits each user using BIOS CMOS setup utility programs. This chapter also covers how to upgrade your computer system.

BIOS CMOS setup utility

This PC adopts BIOS based on Phoenix Technology's latest Award BIOS 6.0 version. The optimum settings for this product are given for each as default.

Users can change settings using the BIOS CMOS setup utility included with this product. The BIOS CMOS setup utility is also useful when making changes to the booting order, when selecting a password, or when adding a new device.

However, if the BIOS CMOS utility setup is wrongly configured, a serious system error can take place such as "unable to boot the system", so be careful when changing the settings.

[For reference]

BIOS CMOS setup refers to setting up the components of the system hardware and saving them. The settings are saved even when the power is off because the settings are stored in CMOS RAM built into the system and powered by internal batteries.

How to change BIOS CMOS setup

Here is a brief outline of how to change CMOS settings using the BIOS CMOS setup utility.

1. Turn on the computer.
2. When the startup page appears, press to activate the BIOS CMOS setup utility. If you press the key too late, it automatically boots Windows. Should that occur, reset the computer and press once again.

Frequency/Voltage Control	You can control the clock and voltage of the CPU.
Load Optimized Defaults	You can change every CMOS setting to the defaults set before shipping.
Set Password	You can set up a password for the CMOS setup utility program
Save & Exit Setup	You can save the current CMOS settings and end the setup utility program.

System upgrades

Hardware upgrades

In order to maintain this product's normal operation and the user's safety, we do not provide warranty services when users upgrade the system on their own. If you disassemble the computer, it may cause system damage or electrical shock.

Please contact one of our sales agencies or customer support centers to upgrade the CPU, hard disk, or memory.

Software upgrades

This product is installed with the latest version of Windows XP OS and basic driver files before it is shipped. However, manufacturers release new improved versions all the time to meet the user's growing needs, so please upgrade to the latest version for major software that is already installed on this PC on a regular basis at the following sites.

- Windows XP Home Edition
<http://update.microsoft.com/>
- Basic driver files (Intel video driver, Realtek audio driver.....)
<http://www.lcdpc.com.cn/Download.asp>(our company web site)

BIOS Upgrade

With this PC, you can upgrade BIOS using the BIOS flash utility.

Visit our Web site on a regular basis to check for latest BIOS file versions our customer support center offers. If there is a most recent version than the one that is displayed on the startup screen of your PC, download it and upgrade.

However, the BIOS upgrade, carried out by electrically refreshing Flash ROM for BIOS can stop the system in the middle of refreshing.

Or when the power is turned off in the middle of refreshing, it becomes impossible to boot the computer. Therefore, if your computer is working well with the current BIOS file, avoid upgrading BIOS.

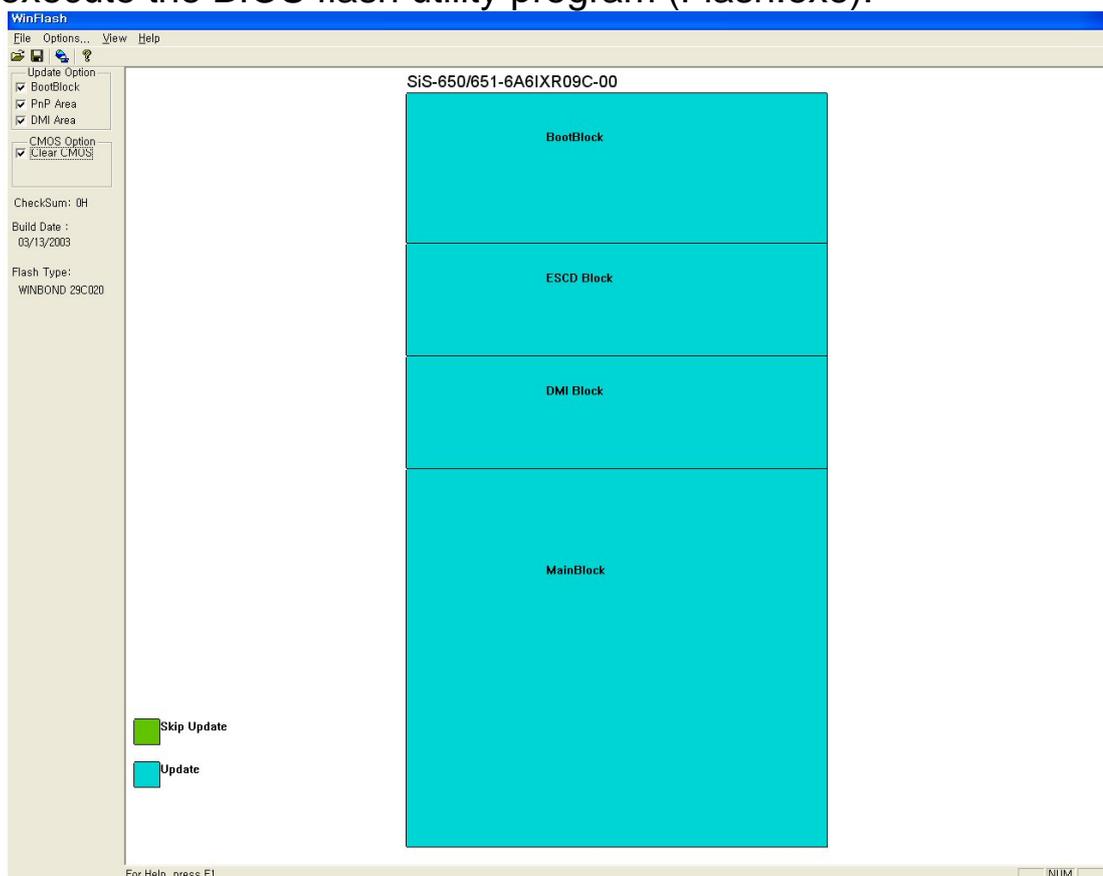

How to upgrade BIOS using the BIOS flash utility program for Windows:

1. First, download an upgraded BIOS file (R961XXX.BIN) and BIOS flash utility program for Windows (Flash.exe & Winflash.sys) at our Web site (www.lcdpc.com.cn).

[For reference]

You can also find a BIOS flash utility for Windows in the ' Software installation' folder on the Master CD that is included with this product.

2. Move to the directory where the downloaded file is located and execute the BIOS flash utility program (Flash.exe).

- 3.** Update BIOS following the instructions displayed on the execution screen and restart the system to reflect the updated BIOS.

Chapter 6. Reinstalling the OS

Should serious irreparable problems occur, users must reinstall a Windows operating system. This chapter will explain how to do that.

To reinstall the OS, you will need the Microsoft Windows installation CD and the Master CD that comes with this product. Please have these at hand before attempting to reinstall the OS.

It is important to note that users need to back up important data stored in the hard disk prior to formatting the hard disc drive and reinstalling the operating system.

How to reinstalling Windows XP

1. Insert the Windows XP Home Edition installation CD into the CD-ROM drive and start up the computer. The “Windows Setup” screen will appear, automatically starting the installation.
2. Continue installing the Windows XP Home Edition following the instructions displayed on the screen.
3. When installation is complete, the computer will restart running Windows XP and the desktop will appear. Insert the Master CD and wait for the automatic execution screen to appear.

Choose each driver and application from the automatic execution screen’s selection menu and install them in the following order.

- Install Intel Chipset video (required)
- Install Realtek ALC655 audio driver (required)
- Install Intel 945G (GMA950) driver (required)
- Install Marvell 88E8053 PCI-E Fast Ethernet NIC driver (required)
- Install USB 2.0 driver (required)
- Install Microsoft DirectX (optional)
- Install touch screen driver (essential when installing touch screen)

[Caution]

In most cases, it is necessary to restart the computer after installing drivers or utilities using the Master CD.

[For reference]

When the video driver is installed, click [Start]-[Control panel]-[Appearance and themes]-[Display] to bring up the “Display Registration Information” screen and choose the desired color quality or screen resolution from the [setting] tab. We suggest that users choose high color (16 bit) or true color (24 bit) for color quality, and 1280 X 1024 pixels for screen resolution.

Click on the [Advance] button at the lower part of the [Setup] tab to bring up the ‘basic monitor and Intel GMA950 registration information’ page. On this page users can choose from among single mode, mirror mode, and multi mode under “Utility Administrator” in the [Driver Mode Setup] menu. Here, it is possible to set up an output to an external monitor or TV.

The Marvell 88E8053 LAN driver does not need to be installed since Windows XP provides the same basic functions. However, if users want to use a variety of functions Marvell offers with the driver, it is recommended that they install it.

4. To check the status of each system device after users are finished installing the above mentioned drivers and programs, click [Start]-[Control panel]-[Performance and maintenance]-[System] to bring up the [Hardware] screen in ‘System registration information’. Here click ‘Device administrator’ to check whether each device is working properly. If the yellow exclamation mark is in front of the device’s name or if the name of the device is not displayed, this means the pertinent device is not functioning normally or it is not properly installed. In this case, users have to update or reinstall the driver for that device.

Appendix 1. Troubleshooting
